Intergenerational Equity

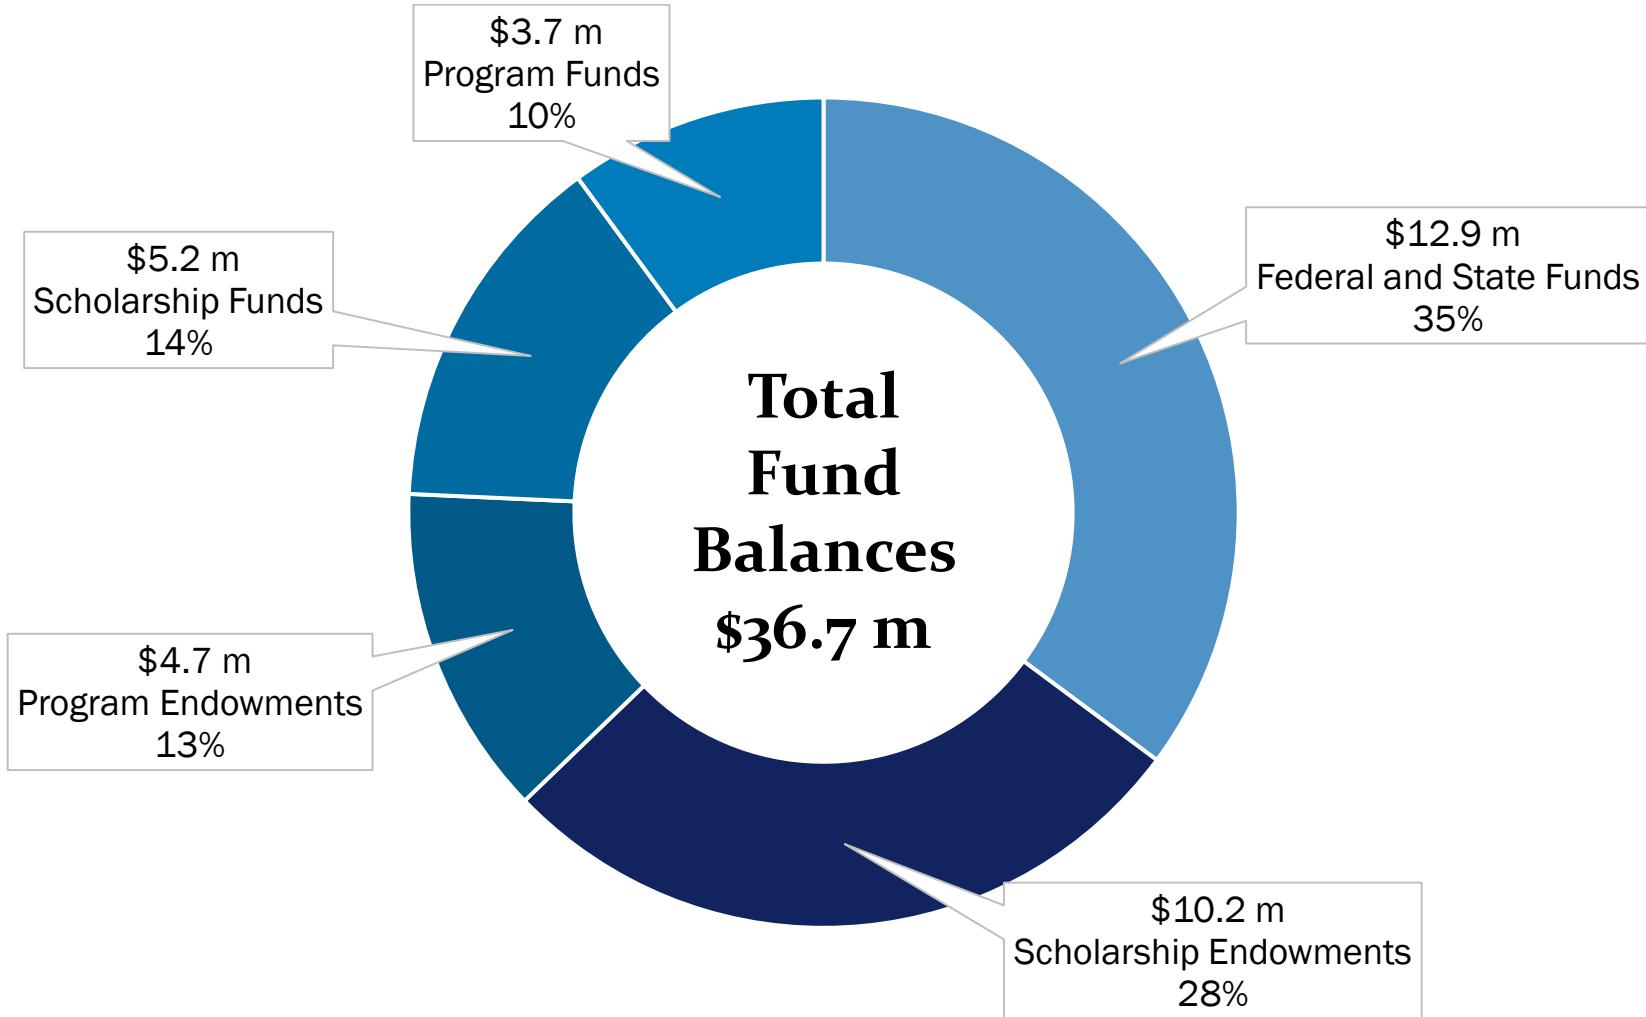

“The trustees of endowed institutions are the guardians of the future against the claims of the present. Their task in managing the endowment is to preserve equity among generations.” -James Tobin (1974)

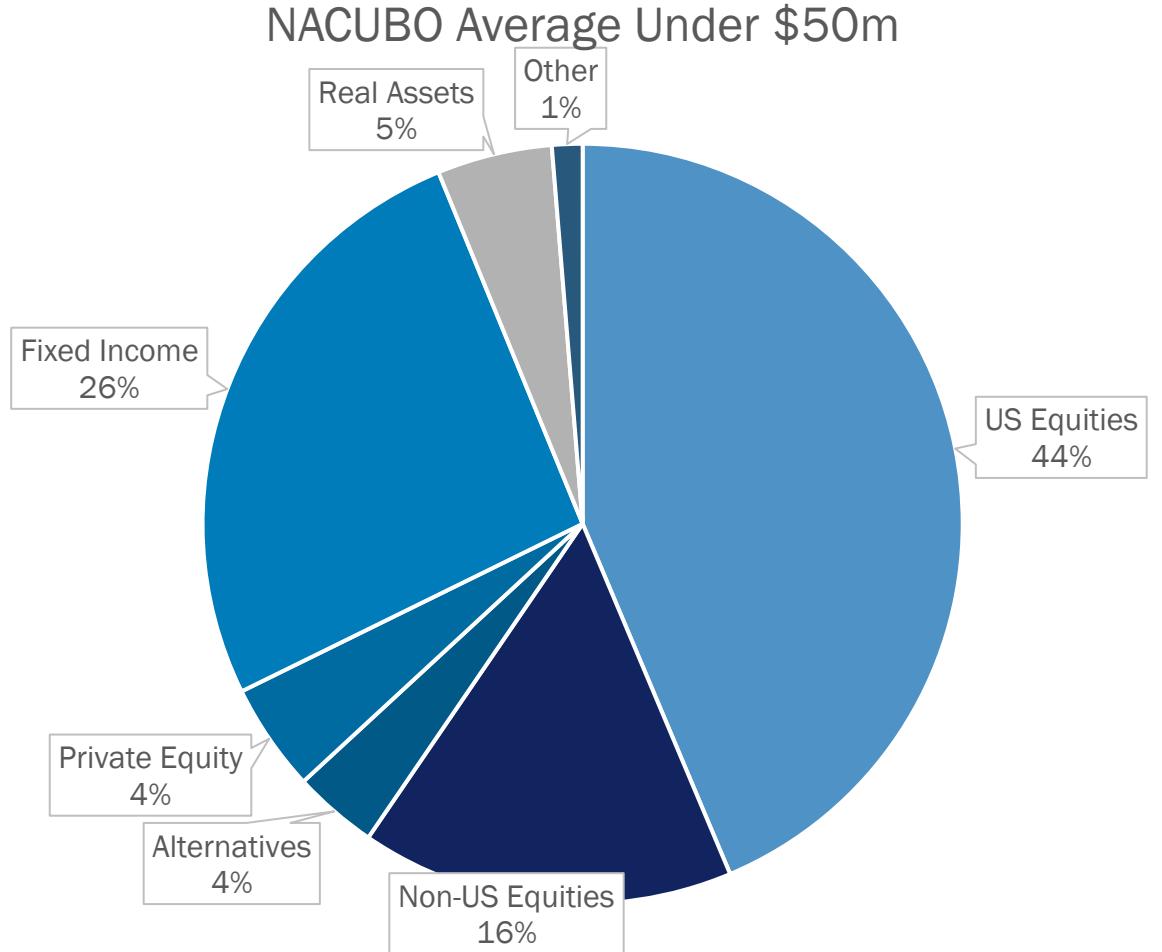

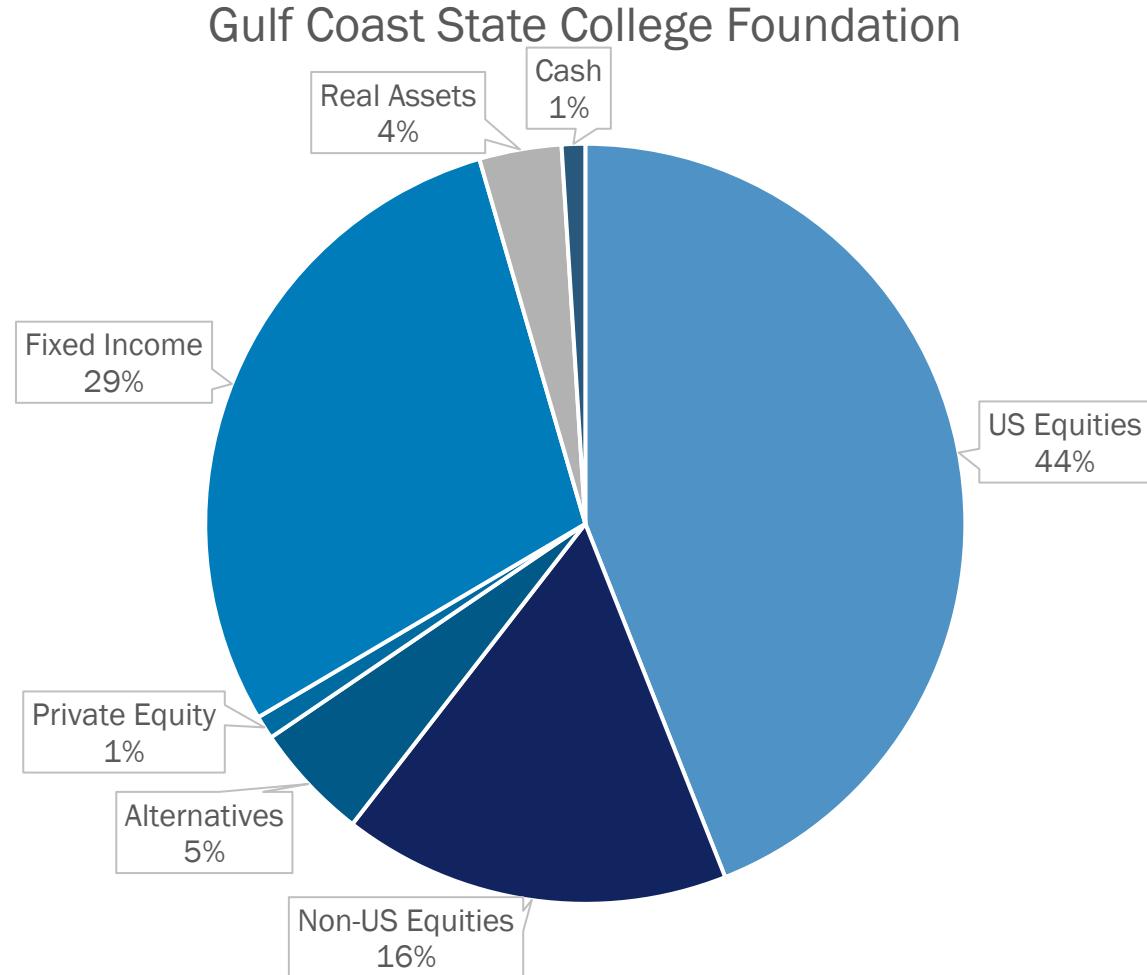

Total Fund Balances as of March 31, 2025

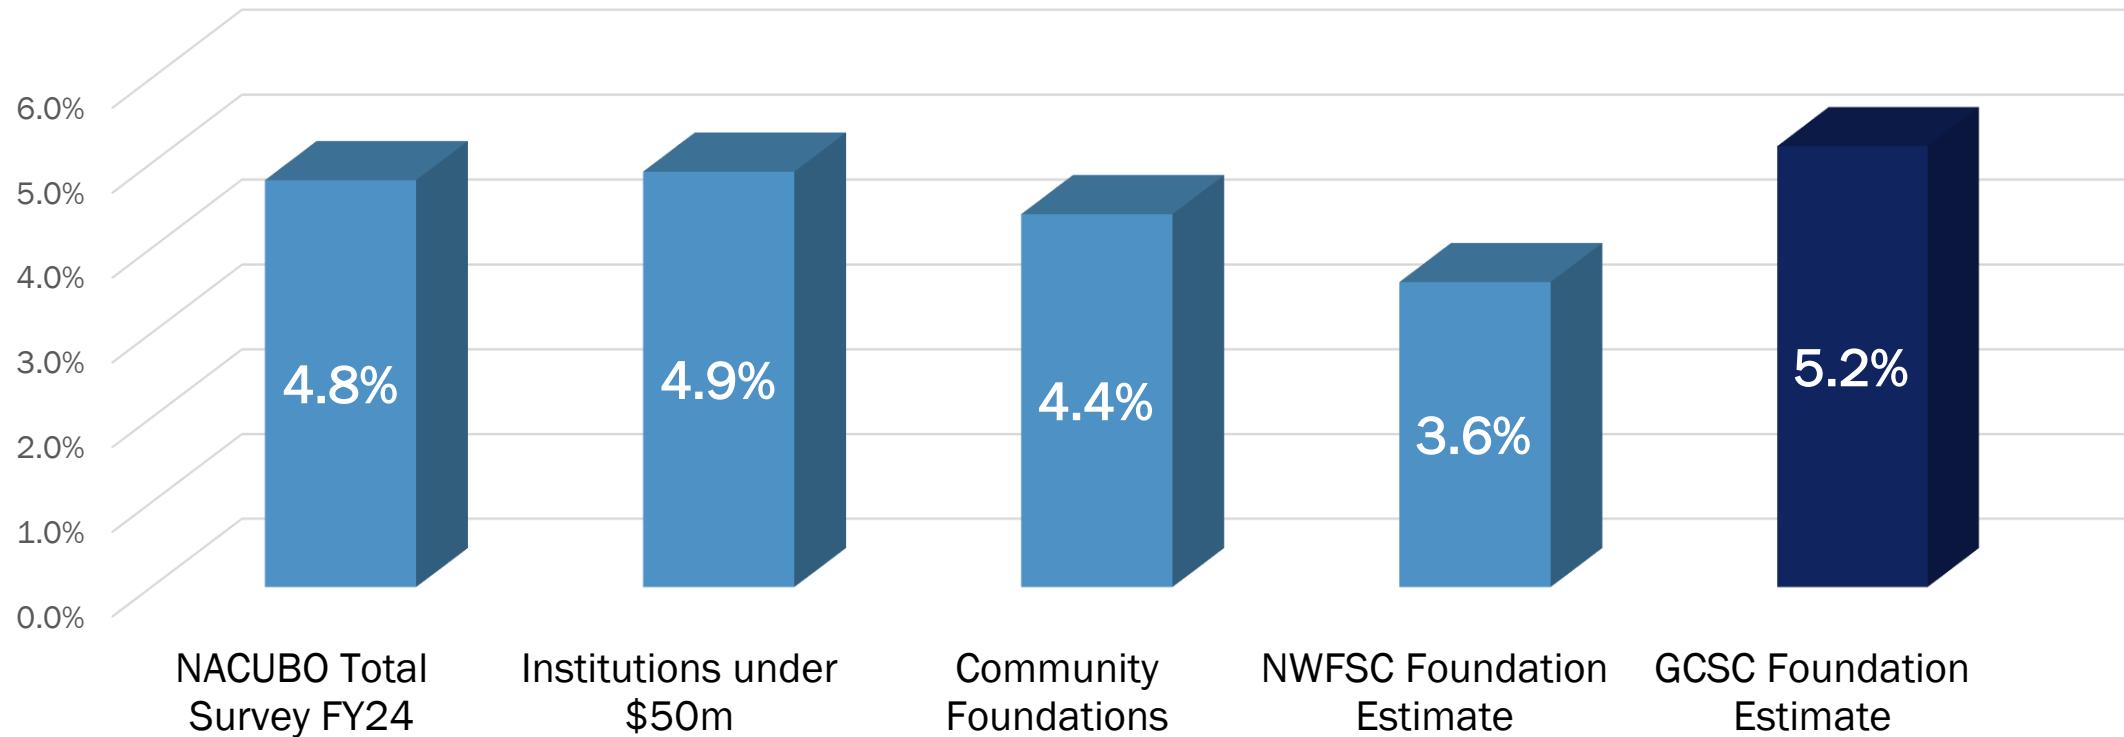

Initial Asset Allocation

Spending Rates of Peers

Average Annual Effective Spending Rates

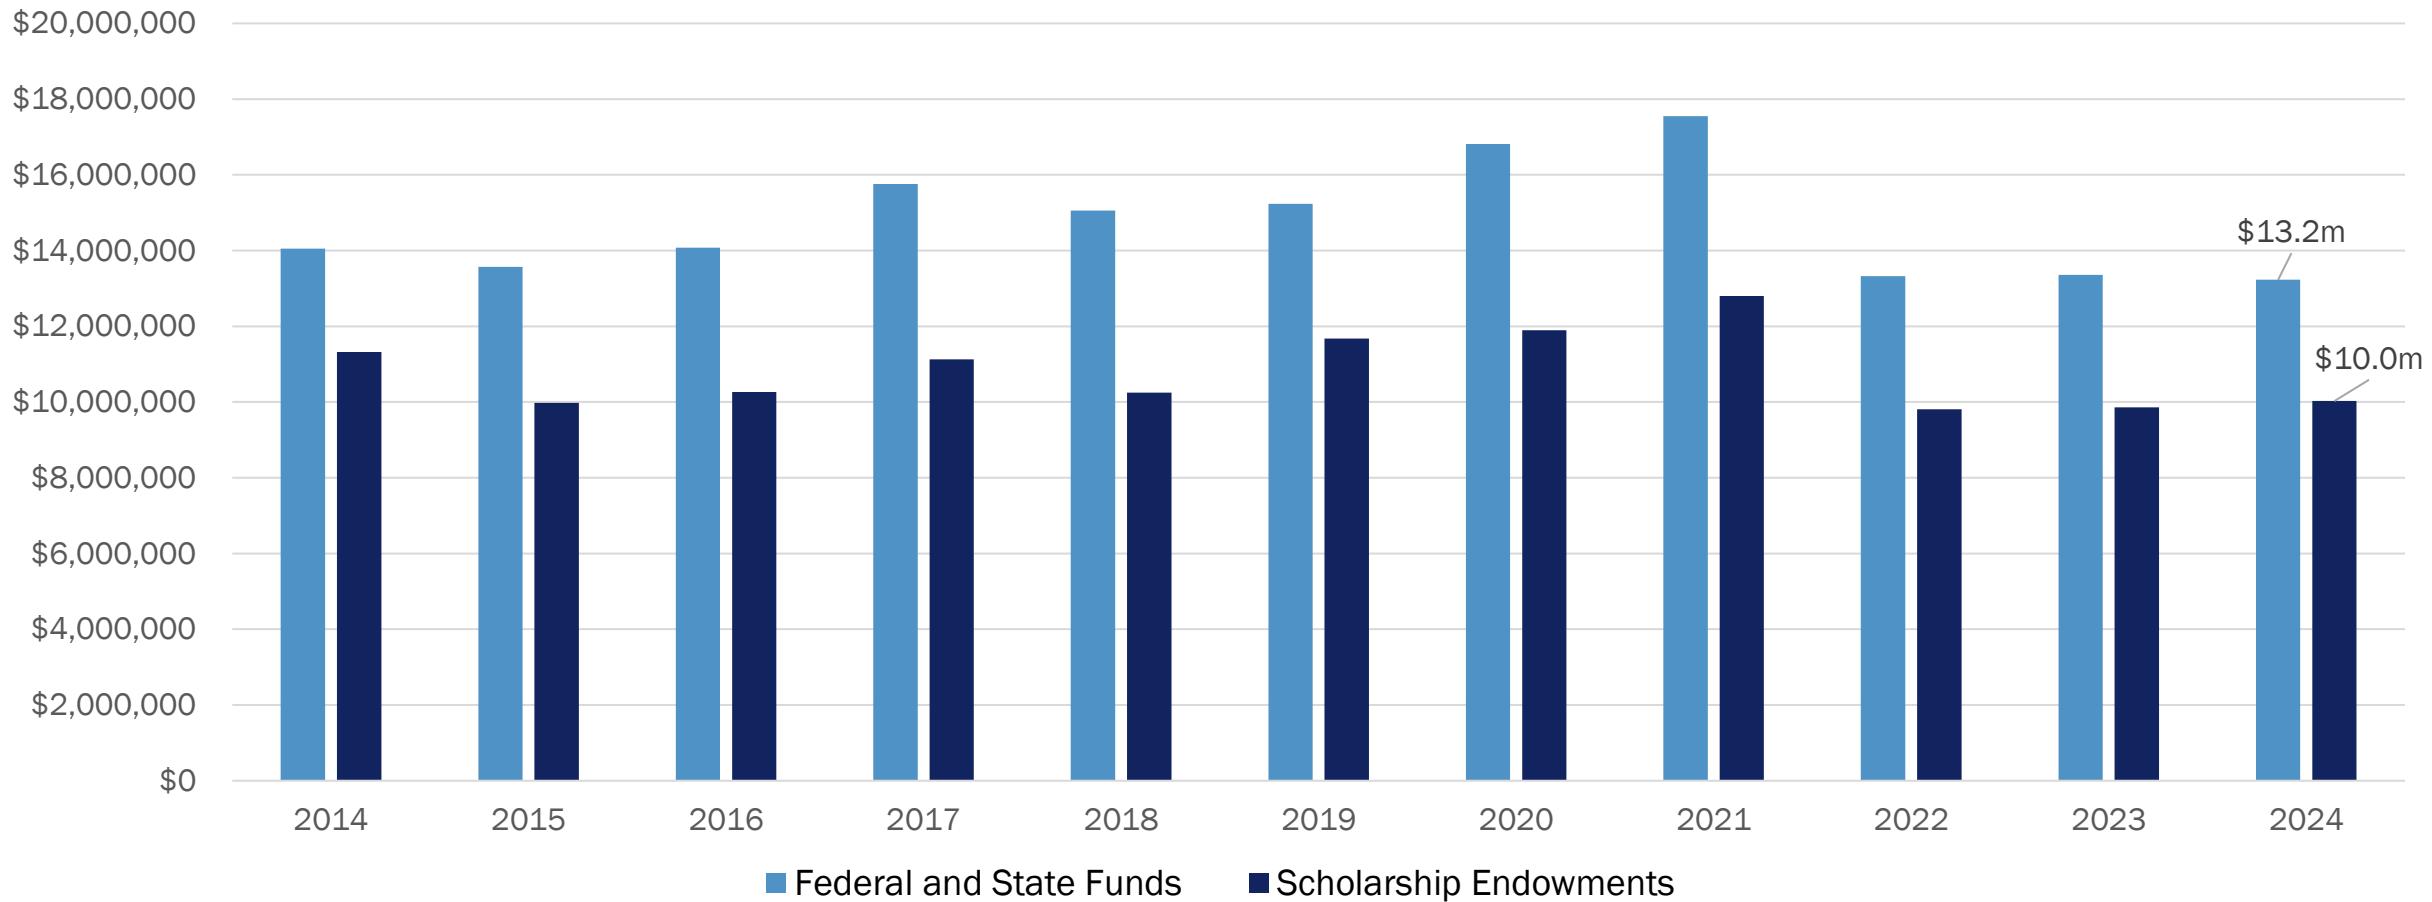

Effective Spending Rate is calculated as the total amount spent from the funds divided by the beginning-of-the-year asset value

Historical Balances of Selected Pools

Fund Balances as of December 31st

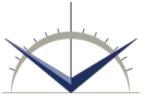

Gulf Coast State College Guarantee

A **5.0%** effective spending rate would require **\$20 million** of endowed assets to fund the estimated **\$1 million** per year required for the Guarantee

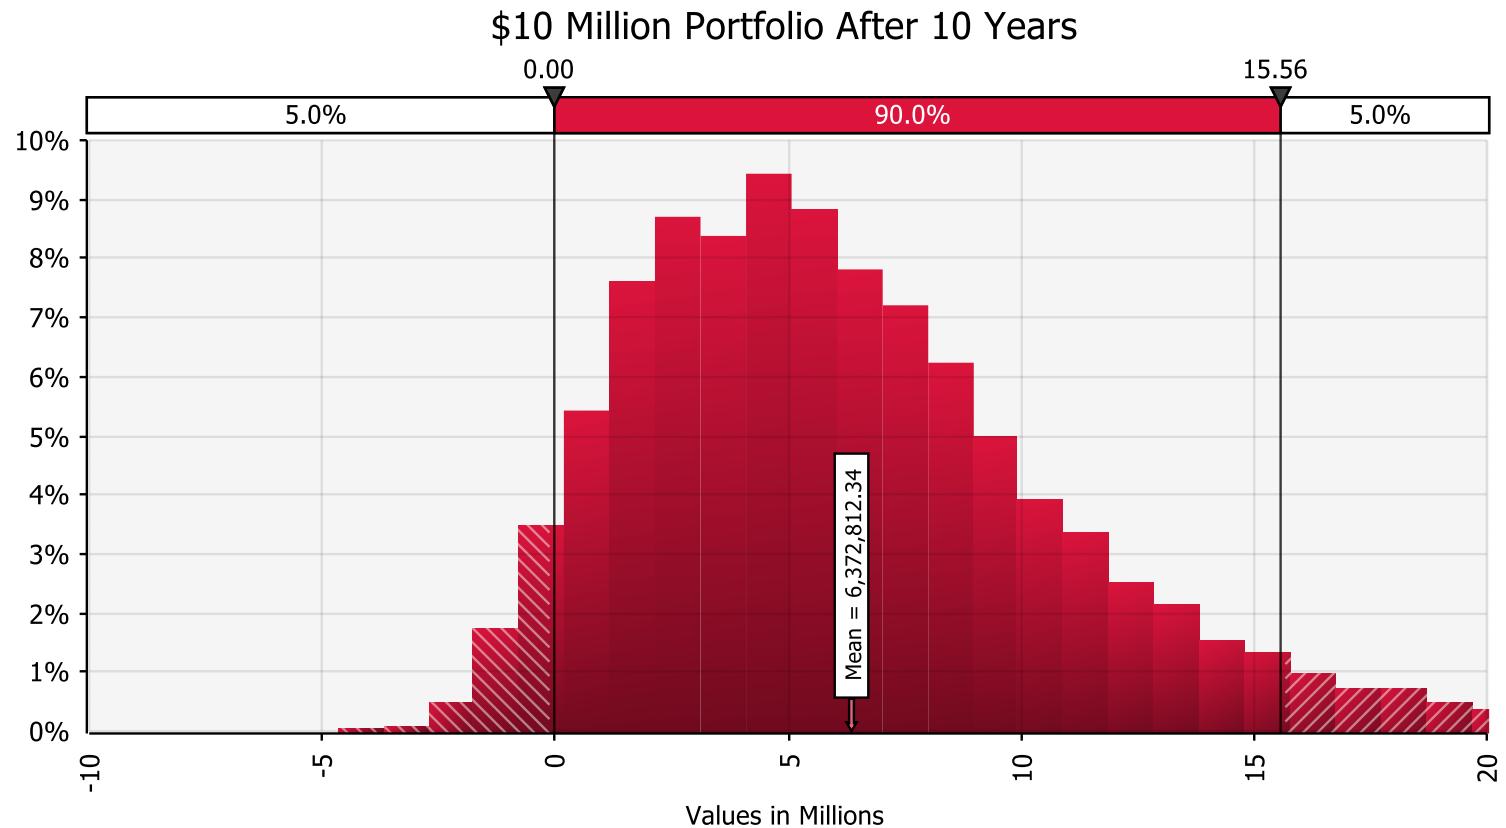

- ✓ The current assets for the GCSC Guarantee is \$4.6 million, and are not being spent to allow for growth
- ✓ Approximately \$1 million per year is drawn from the Federal and State Funds to cover the Guarantee, and all our modeling assumes this continues annually
- ✓ As the assets grow, you may consider drawing from the GCSC Guarantee assets in good market years, and drawing from the Federal and State Funds in poor market years

The challenge: funding the Guarantee while growing the assets through fundraising and investment returns.

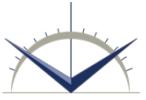

Modeling Risks for the GCSC Guarantee

- When the GCSC Guarantee assets get to \$10 million, there remains a substantial risk of running out of money when spending \$1 million every year
- If the assets grow to \$15 million, the probability of running out of money drops to approximately 5%
- At \$20 million in assets, the probability is less than 1% of ever running out of money when spending \$1 million per year

Modeling Future Values of the GCSC Guarantee

Starting Portfolio (\$)	10,000,000	12,700,000	15,000,000	20,000,000
	Portfolio in 10 Years			
Average Case	6,382,886	12,406,485	17,556,313	28,676,405
Best Case	24,148,552	38,223,637	48,294,487	72,162,255
Worst Case	(2,371,518)	77,295	1,861,539	6,044,087
95th Percentile	15,573,151	25,650,401	34,108,659	52,176,203
75th Percentile	8,905,304	16,020,402	22,206,706	35,415,329
50th Percentile	5,557,690	11,253,283	16,191,711	26,664,006
25th Percentile	2,930,413	7,393,246	11,217,410	19,620,453
5th Percentile	(7,775)	3,382,715	6,061,636	12,177,550

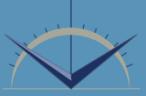

Endowed Funding for Scholarships

To maintain \$1,400 per year x 781 scholarships with a 5.0% effective spending rate you need **\$21.9 million** in endowed assets

- ✓ Permanent Endowed assets totaled \$14.9 million as of March 31, 2025
- ✓ Your 2025/26 spending draw for 781 scholarships at \$1,400 per year totals approximately \$1.1 million – this works out to a 7.3% effective spending rate, an unsustainable level
- ✓ Your current Endowed assets can only support approximately \$950 per year at a 5% spending rate
- ✓ One scholarship to fund \$1,400 per year in perpetuity should be \$28,000 – \$35,000
- ✓ With the inability for current assets to fund \$1,400 per year, you may consider more than \$35,000 for future endowments

The challenge: how much fundraising is needed to support both current and future scholarships?

NOTE: Forecasts of investment returns are heavily affected by the length of the forecasting period ("horizon"). "Expected" returns developed in this assumption-set are inherently biased toward a 3-5 year forecasting horizon, because the base building block reflects the current US risk-free borrowing rate and its counterpart, the current inflation-expectation rate.

By contrast, as the length of the forecasting horizon increases, the impact of today's risk free and inflation rates disappear, replaced by long term index returns (shown) which become increasingly more probable forecasts of expected outcomes.

[A practical alternative to a single, long-horizon forecast is a series of 3-5 year forecasts, accompanied by appropriate marginal adjustments of investment allocation at each re-forecast.]

¹ 5 Year US Treasury Notes (as of January 2025)

² Asset Class factor generally refers to a demonstrated premium return from asset categories.

³ These categories are actively managed universes, grouped according to strategies and measured according to return premia.

⁴ Historical returns and correlations were measured at quarterly intervals from 1/1/1955 to 12/31/2023 (or inception of the data for fixed income and equity, if later than 1955).

⁵ Some alternative strategy benchmarks had historical returns that began before 1994, but that was not included in order to standardize correlations across alternative strategies.

⁵ Market Implied Inflation = Yield differential between 10 Year Treasuries and 10 Year TIPS (as of January 2025)

IMPORTANT DISCLOSURES ABOUT THE RELIABILITY OF INVESTMENT FORECASTS

I. The Limitations of Investment Forecasting - in General:

1. The accuracy of any forecast of investment outcomes is entirely dependent upon how well **certain assumptions** match up with the actual future results from investment categories about which the assumptions were made. To create a **multi-asset forecasting model**, 3 key assumptions are required for each investing category: (1) rate of expected annual return, (2) expected volatility of those returns and (3) correlation of returns with those of the other categories included in the model.
2. Probably the most crucial assumption for investment forecasts is the selected length of **future time period** ("Time Horizon") over which the investment's expected outcomes are to be forecasted.
 - (a) Investment categories that are more volatile than others will generally require a longer Time Horizon in order for its forecasted average annual return to be reasonably reliable. Ex: stocks require a longer Horizon than bonds.
 - (b) Extrapolation of the recent (e.g. 5 years, or less) performance history of an investment category is usually a poor approach to setting expectations for its future returns.
3. The occurrence, timing and impact of **sporadic traumatic events** that affect the behavior of otherwise orderly securities markets is not forecastable.

II. Forecasting Results* Produced by FiduciaryVest, LLC:

1. For client use, FiduciaryVest produces investment forecasting models that are exclusively designed for multi-year asset allocation purposes over periods of at least 3 to 5 years, or longer. The models generate *stochastic* output results [i.e., range(s) of expected outcomes, presented as higher-to-lower probability of future occurrence].
2. FiduciaryVest typically creates forecasting assumptions for its models, based upon: (a) a 5-year Time Horizon, (b) the apparent cyclical stage of the primary investment markets, at the time the model is created, (c) the current interest rate yield on US Treasury notes and (d) long term historical patterns of returns, volatility, correlation and "risk premium" for each asset class being included in the model.
3. Although the assumptions are expressed in annual terms, the FiduciaryVest modeling process makes no attempt to forecast one-year results. Multi-year forecast periods are presumed to produce more reliable forecasting results.
4. FiduciaryVest creates forecasting models using state-of-the-art software tools and a widely recognized assumption-setting approach. However, there can be no assurance as to the degree of accuracy produced in the forecasts, especially with respect to any particular future period.

* FiduciaryVest may produce forecasting models using different assumptions for different clients, especially when delivered at different points in time. Unless provided under a formal service agreement, FiduciaryVest accepts no responsibility to routinely provide updates for delivered forecasts which may have become outdated.
